ActiveLogix Selected to Distribute CSI³ Software Drivers

ActiveLogix to Distribute New Niagara AX Based Drivers to Simplify Building Automation Integration

Charlotte, NC – June 20, 2007 – ActiveLogix LLC, a leading provider of Internet-based enterprise automation solutions, announced today that it has begun distributing new CSI³ software drivers compatible with the Niagara AX automation infrastructure. ActiveLogix provides integration technology and associated products to Solution Partners across the Southeast USA. ActiveLogix Solution Partners continue to express a high degree of interest in products that protect an owner's prior automation investments, reduce installation time on projects and improve ROI.

Through its Solution Partner Program, ActiveLogix provides Systems Integrators with Internet-based Machine to Machine (M2M) technologies, and support. The program is designed to help integrators deliver complete real-time data and event-driven solutions to their customers. Many partners will use the software drivers to integrate, instead of replacing, existing proprietary automation devices. This allows integrators to manage and control their job costs and risk. The reduced risk can have a profound impact on their bottom line and improve the ROI and installation timeline for end users." We share a common vision with the CSI³ development group" says Greg Barnes, Vice President of Business Development. "Our Solution Partners are looking for cost effective ways to connect machines to man (M2M). Because the CSI³ solutions are built by an experienced Niagara AX developer and can be quickly be deployed, we believe it will allow more end users to justify implementing state of the art browser-based systems."

The Machine to Machine sector is a highly diverse market that includes networking manufactured product with onboard embedded smart devices to enterprise level applications. It is increasingly being regarded as a key growth sector over the coming decade. Often described as the 'next wave of the Internet', the data collected can be integrated into existing automation or monitoring systems and viewed via a standard browser or via standard databases. "We believe ActiveLogix continues to be in a unique position, said Greg Barnes, Vice President of Business Development at ActiveLogix. "ActiveLogix has the experience to provide and support integration technology and the associated components needed to deliver M2M solutions. We also have the distribution channel that can implement these solutions cost effectively in a growing segment of the US."

About ActiveLogix

ActiveLogix provides a software framework that integrates diverse devices, databases and systems — regardless of manufacturer, communication standard or software product. This browser-based solution enables customers to easily manage and control real time business events, maximize facility assets and predict future operating conditions. Typical customer applications include building automation, energy services, and service or maintenance management.

ActiveLogix is a privately held software company headquartered in Charlotte, NC and markets its products to end users, original equipment manufacturers and a network of independent systems integrators. Additional information about ActiveLogix is available at www.activelogix.com or contact ActiveLogix at 704.553.8510.
